

2017 Kentucky Small Grain VARIETY PERFORMANCE TEST

B. Bruening, B. Roberts, S. Swanson, J. Connelley, G. Olson, A. Clark, and D. Van Sanford, Plant and Soil Sciences

www.uky.edu/ag/WheatVarietyTest

The 2017 soft red winter wheat growing season ended with Kentucky farmers harvesting approximately 350,000 acres of the 490,000 acres planted, for a total production of 25.2 million bushels of grain. An average yield of 72 bushels per acre was expected (Table 1). The acreage not harvested for grain was primarily used for forage production and cover cropping.

Small grain performance tests were conducted in six of the seven agroclimatic regions of Kentucky (Table 2). Agricultural areas within each region are considered to have similar soil types and climatic conditions. Each region having a substantial acreage of a small grain commodity had at least one trial conducted in that region for that commodity.

The objective of the Kentucky small grain variety performance test is to evaluate varieties of wheat, oat, barley, triticale, and cereal rye that are commercially available or may soon be available to Kentucky farmers. New varieties continually are being developed by agricultural experiment stations and commercial firms. Annual evaluation of small grain varieties and selections provides farmers, seed producers, and other agricultural workers with current information to help them select the varieties best adapted to their locality and individual requirements.

Because weather, soil, and other environmental factors may alter varietal performance from one location to another, seven wheat tests were conducted at seven locations throughout the state (Table 2). In addition, wheat tests for varietal differences in forage yield and straw yield were conducted at one location.

Experimental Methods

A total of 103 wheat entries were evaluated under both conventional and no-till cultural practices. No-till tests were grown at two locations, and conventional tests were grown at five locations. The experimental design was a randomized complete block. The tests had four replications per entry, and the data presented are the average response from the four replications.

The plots were planted with specially built multi-row conventional and no-till cone seeders. Conventional test plots consisted of six rows to form a plot 4 feet wide and 15 feet long, which was later trimmed to 12 feet in length. No-till plots consisted of seven rows to form a plot 5 feet wide and 25 feet long, which was

later trimmed to 20 feet in length. Plots were harvested with a small-plot combine. The preceding crop for all tests was corn.

Tests were conducted using intensive management practices. Typical herbicide applications included a spring application for broadleaf control and a fall preplanting burn-down (no-till tests only) application. Fungicides were applied in the spring on all but one (disease rating) test. An insecticide for aphid control was typically applied in the fall and spring. Nitrogen was applied

5 Southern Tier	Logan Co.	Don Halcomb	Wheat*
	Todd Co.	Tim, Wade and Maurice Chester	Wheat*
6 North Central	Woodford Co.	UK Woodford Farm Shannon Rudd	Wheat*, triticale, oat, cereal rye

* Conventional tillage.

in a February/March split application at a rate of approximately 30/60 pounds per acre (conventional tests) or 40/70 pounds per acre (no-till).

The forage test was planted using conventional tillage and was harvested using a small plot forage combine at the soft dough stage. Straw yield was measured using a small plot forage combine following grain harvest in the Bluegrass region test.

Characteristics Evaluated

Grain yields were calculated from the weight of grain from each plot and reported in bushels per acre (bu/ac) based on 60-pound, 56-pound, 48-pound, and 32-pound standard bushel weights for wheat, cereal rye, barley, and oats, respectively, at 13.5 percent moisture content. Test weights (lb/bu) were determined using a HarvestMaster Classic GrainGage and adjusted to 13.5 percent moisture. Lodging was reported as the percentage of plant lodging at maturity; winter survival was reported as the percentage of survival after spring green-up. Winter survival was 100 percent for all wheat, barley, triticale, and cereal rye tests. Plant height was measured in inches from the soil surface to the top of the grain head. Heading dates were reported as the day an estimated 50 percent of the heads had extended above the flag leaf collar. Disease ratings: powdery mildew, head scab, leaf rust, stripe rust and Septoria leaf blotch were recorded at the Fayette County (non-fungicide) forage test. Forage and straw yields are expressed as dry matter in tons per acre.

Results and Interpretation

Since genetic expression of a variety is greatly influenced by environmental conditions, it is best to have several years' data at multiple locations from which to draw conclusions. Performance of a variety tested for only one year should not be compared with a multi-year average of another variety because it is possible that results in one of the other years were extremely good or poor and thus not comparable.

The yield of a variety is relative and should be compared with the yields of the other varieties in the same experiment and at the same location or within the same analysis across locations. Small differences in yield of only a few bushels per acre between two varieties from an individual test should not be interpreted to indicate the superiority of one variety over another. However, if one variety consistently out yields another over a period of several years, the chances are that the differences are real. LSD (least significant difference) values are listed at the bottom of table columns to indicate whether differences are statistically significant.

Lodging data are difficult to interpret. A high-yielding variety should not necessarily be downgraded because of a high percentage of lodging for a given year at a given location. Local weather conditions, such as wind and rain, may cause a variety to lodge

much more than it normally does. Variety trials normally have a greater degree of lodging than do farmer fields. It also should be emphasized that a variety reported to be 50 percent lodged does not imply that only 50 percent of the grain could be harvested. With good equipment, most of the grain can often be saved.

Kentucky's climate and soils are well-suited for the production of high-quality soft red winter wheat. No single variety has all the desirable characteristics, but each has certain advantages. Yield potential, straw strength and yield, height, heading date, grain quality, disease resistance, and forage potential are important in choosing a variety.

Winter barley is less winter-hardy than winter wheat but more hardy than winter oats. The degree of winter-hardiness, straw strength, and maturity are important characteristics when choosing a variety. Barley (hulless and hulled) variety performance data are presented in tables 14 and 15. Cereal rye, triticale, and oat variety performance data are presented in tables 16, 17, and 18, respectively.

Test Conditions

Average temperatures and precipitation during October favored timely planting throughout many areas of the state. The 2017 Kentucky small grain variety tests were planted from October 10 to October 19. Record warm temperatures in January and February accelerated growth and development. A severe freeze occurred in mid-March with multiple days of low temperatures in the mid-teens across the state. Temperatures were above average in April and normal in May. Wheat headed several weeks earlier than normal and matured about a week earlier than normal. Dry and warm conditions during early June favored dry-down and harvest. Heavy rains in mid-June slowed harvest in some area of the state.

Acknowledgments

Thanks to the following individuals for their support and assistance with this project: Kentucky Small Grain Growers Association, Don Halcomb, Brian Rouse, Wade, Tim & Maurice Chester, Mike Burchett, Randy Hagan, Rankin Powell, Shannon Rudd, Cam Kenimer, Curt Judy, Chad Lee, Dennis Egli, Bobby Orange, Joe Williams, Scott Peek, Michael Carter, Shawn Wood, Zeak Jamison, Jackie Harper, and the UK Wheat Science Group.
