

# 2022 Kentucky Small Grain

## VARIETY PERFORMANCE TRIAL

B. Bruening, P. Shine, S. Swanson, J. Connelley, G. Olson, and D. Van Sanford, Plant and Soil Sciences

[www.uky.edu/ag/WheatVarietyTest](http://www.uky.edu/ag/WheatVarietyTest)

The 2022 soft red winter wheat growing season ended with Kentucky farmers harvesting approximately 400,000 acres of the 540,000 acres planted, for a total production of 30.8 million bushels of grain. An average yield of 77 bushels per acre was estimated by the National Agricultural Statistics Service (Table 1). The acreage not harvested for grain was primarily used for forage production and cover cropping.

The objective of the Kentucky small grain variety performance trial is to evaluate varieties of wheat, oat, barley, triticale, and cereal rye that are commercially available or may soon be available to Kentucky farmers. New varieties continually are being developed by agricultural experiment stations and commercial firms. Annual evaluation of small grain varieties and selections provides farmers, seed producers, and other agricultural workers with current information to help them select the varieties best adapted to their localities and individual requirements.

Seven wheat performance trials were conducted in six of the seven agroclimatic regions of Kentucky (Table 2). Agricultural areas within each region are considered to have similar soil types and climatic conditions. Barley, oat, triticale, cereal rye and spelt varietal performance was evaluated at one location. In addition, wheat trials for varietal differences in forage yield and straw yield were conducted at one location.

### Experimental Methods

A total of 84 wheat entries were evaluated under either conventional or no-till cultural practices. No-till trials were grown at three locations, and conventional trials were grown at four locations. The experimental design was a randomized complete block. The trials had four replications per entry, and the data presented are the average response from the four replications.

The plots were planted with specially built multi-row conventional and no-till cone seeders. Conventional trial plots consisted of six rows to form a plot 4 feet wide and 15 feet long, which was later trimmed to 12 feet in length. No-till plots consisted of seven rows to form a plot 5 feet wide and 25 feet long, which was later trimmed to 22 feet in length. Plots were harvested with a small-plot combine. The preceding crop for all trials was corn.

Trials were conducted using intensive management practices. Typical herbicide applications included a spring application for broadleaf control and a fall preplanting burn-down (no-till trials only) application. Fungicides were applied in the spring on all but

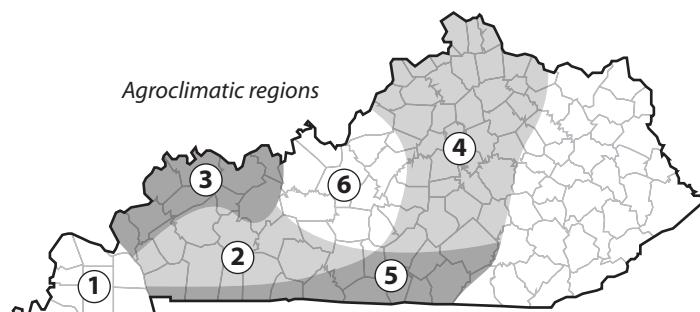

two (disease rating) trials. An insecticide for aphid control was typically applied in the fall and spring. Nitrogen was applied in a February/March split application at a rate of approximately 30/60 pounds per acre (conventional trials) or 40/70 pounds per acre (no-till).

The forage trial was planted using conventional tillage and was harvested using a small plot forage combine at the soft dough stage. Straw yield was measured using a small plot forage combine following grain harvest in the Bluegrass region trial.

**Table 1. Wheat Acreage Harvested and Yields (bu/ac) in Kentucky, 2020-22.\***

2022		2021		2020	
Harvested	Yield	Harvested	Yield	Harvested	Yield
400,000	77	370,000	87	340,000	63

\*July 12, 2022, National Agricultural Statistics Service.

**Table 2. Agroclimatic Regions of Kentucky Small Grain Variety Trials.**

Region	Location	Cooperator	Crop Tested
1 Purchase	Fulton Co.	Henry Sanger	No-till wheat
2 Western Coal Field	Caldwell Co.	Princeton Research and Education Ctr.	Wheat*, barley
3 Ohio Valley	Webster Co.	Bruce and Jeremy Benson	No-till wheat
4 Bluegrass	Fayette Co.	Kentucky Ag. Exp. Station	Wheat*, small grains
5 Southern Tier	Logan Co.	Halcomb Farm	Wheat*
	Christian Co.	Brandon Hunt	No-till wheat
6 North Central	Woodford Co.	UK Woodford Farm Shannon Rudd	Wheat*

\* Conventional tillage.

## **Characteristics Evaluated**

Grain yields were calculated from the weight of grain from each plot and reported in bushels per acre (bu/ac) based on 60-pound, 56-pound, 48-pound, and 32-pound standard bushel weights for wheat, cereal rye, barley, and oats, respectively, at 13.5 percent moisture content. Test weights (lb/bu) were determined using a HarvestMaster Classic GrainGage and adjusted to 13.5 percent moisture. Lodging was reported as the percentage of plant lodging at maturity; winter survival was reported as the percentage of survival after spring green-up. Winter survival was 100 percent for all trials, except oats. Plant height was measured in inches from the soil surface to the top of the grain head. Heading dates were reported as the day an estimated 50 percent of the heads had extended above the flag leaf collar. Disease ratings: Leaf rust, leaf blotch and head scab were rated at both the Fayette County trial and the Logan County trial. Powderly mildew, glume blotch and stripe rust were rated at the Fayette County trial.

Forage and straw yields are expressed as dry matter in tons per acre. Winter cover crop ground cover/biomass values were measured using the Canopeo app at the Fayette County wheat trial on 1-6-2022.

## **Results and Interpretation**

Since genetic expression of a variety is greatly influenced by environmental conditions, it is best to have several years' data at multiple locations from which to draw conclusions. Performance of a variety tested for only one year should not be compared with a multi-year average of another variety because it is possible that results in one of the other years were extremely good or poor and thus not comparable. Data from 2020 were not included because of widespread freeze damage across the state in that year.

The yield of a variety is relative and should be compared with the yields of the other varieties in the same experiment and at the same location or within the same analysis across locations. Small differences in yield of only a few bushels per acre between two varieties from an individual trial should not be interpreted to indicate the superiority of one variety over another. However, if one variety consistently outyields another over a period of several years, the chances are that the differences are real. LSD (least significant difference) values are listed at the bottom of table columns to indicate whether differences are statistically significant.

Lodging data are difficult to interpret. A high-yielding variety should not necessarily be downgraded because of a high percentage of lodging for a given year at a given location. Local weather conditions, such as wind and rain, may cause a variety to lodge much more than it normally does. Variety trials normally have a greater degree of lodging than do farmer fields. It also should be emphasized that a variety reported to be 50 percent lodged does not imply that only 50 percent of the grain could be harvested. With good equipment, most of the grain can often be saved.

Kentucky's climate and soils are well-suited for the production of high-quality soft red winter wheat. No single variety has all the desirable characteristics, but each has certain advantages. Yield potential, straw strength and yield, height, heading date, grain quality, cover cropping potential, disease resistance, and forage potential are all important in choosing a variety.

Winter barley is less winter-hardy than winter wheat but more hardy than winter oats. The degree of winter-hardiness, straw strength, and maturity are important characteristics when choosing a variety. Barley (hulless, malting, and traditional hulled) variety performance data is presented in Table 14. Triticale, cereal rye, oat, and spelt variety performance data are presented in Tables 15, 16, 17, and 18 respectively.

## **Trial Conditions**

Average temperature and below normal precipitation in October favored timely planting of the wheat variety trials. The 2022 Kentucky small grain variety tests were planted from October 14 to October 23. Cooler and dryer conditions in November were followed by well above average temperatures and precipitation levels in December, which promoted vegetative growth and development. January had below normal temperatures and precipitation. February had normal temperatures and precipitation. March brought above average temperatures and below average precipitation, which reinitiated plant growth and development. April had below normal temperatures and above average precipitation, which slowed reproductive development until May brought much warmer temperatures and higher levels of precipitation. June was hot and dry, which accelerated wheat maturity and dry-down and favored a timely harvest period.

## **Acknowledgments**

Thanks to the following individuals for their support and assistance with this project: Kentucky Small Grain Growers Association, Siemer Milling Company, the Halcomb family, Brandon Hunt, Henry Sanger, Ben Rudy, Robert Rouse, Bruce and Jeremy Benson, Vicki Shadrick, Scott Peek, Shannon Rudd, Matt Peak, Cam Kenimer, Curt Judy, Dennis Egli, Bobby Orange, Michael Carter, Jackie Harper, and the UK Wheat Science Group.
